Zavoda za eksperimentalnu fiziku i Zavoda za teorijsku fiziku PMF-a)

Poisson source and basic constructions of Braided Geometry

Dimitri Gurevich
Valenciennes University, France

Datum: utorak 24. svibnja 2011.

Vrijeme: 12:00 c.t.

Mjesto: IRB, dvorana I krila

Sažetak:

Braided Geometry is a sort of Geometry related to a braiding, i.e. a solution of the Quantum Yang-Baxter Equation. All objects and operators of this theory (Lie algebras, varieties, traces) are "braided". Typical examples of such a Geometry are those related to the Quantum Groups $U_q(sl(n))$ (or their super-analogs). In my talk I plan to describe these examples in details, to explain the role played in this construction by the Reflection Equation Algebra, and to exhibit a way of getting corresponding objects via quantizing some Poisson structures defined on $gl(n)^*$.
